

Description Logic Syntax and Semantics

1 Preliminaries

Let $\mathcal{I}$ be an interpretation with non-empty domain $\Delta^{\mathcal{I}}$. Each atomic concept A is interpreted as a set $A^{\mathcal{I}} \subseteq \Delta^{\mathcal{I}}$, each atomic role R as a binary relation $R^{\mathcal{I}} \subseteq \Delta^{\mathcal{I}} \times \Delta^{\mathcal{I}}$, and each individual name a as an element $a^{\mathcal{I}} \in \Delta^{\mathcal{I}}$.

Concept descriptions denote subsets of $\Delta^{\mathcal{I}}$. Role descriptions denote binary relations over $\Delta^{\mathcal{I}}$. For planning states, let s denote the set of atoms true in the current state, and let γ denote the set of goal literals.

4 Restrictions on Role Interpretations

Functional roles. A feature f is interpreted as a functional binary relation:

$$\forall a, b, c. (a, b) \in f^{\mathcal{I}} \wedge (a, c) \in f^{\mathcal{I}} \Rightarrow b = c.$$

Equivalently, features may be viewed as partial functions.

Transitive roles. A transitive role R is interpreted as a transitive binary relation:

$$\forall a, b, c. (a, b) \in R^{\mathcal{I}} \wedge (b, c) \in R^{\mathcal{I}} \Rightarrow (a, c) \in R^{\mathcal{I}}.$$
